LISTING OF CLAIMS

No amendments to the claims are submitted with this paper. The following listing of claims is presented solely for the Examiner's convenience:

1. (Previously Presented) A surgical needle, which comprises:

an elongated substantially linear needle body defining a central longitudinal y-axis along which the needle body extends and transverse x and z-axes, the needle body including a central shaft portion, a first suture end portion for attachment to a suture and a second needled end portion for penetrating tissue, the needled end portion having three sides which intersect to define three cutting edges and terminate at a needle point, each side including one sole pair of planar surface portions arranged in oblique relation to define a general concave appearance to each side, the needled end portion further defining an enlarged transition portion adjacent the central shaft section, the enlarged transition portion defines a z-dimension "z₁" and an x-dimension "x₁", "x₁" being greater than a corresponding x-dimension "x₁" of the central shaft, wherein the z-dimension "z₁" is defined as being transversely perpendicular to the central longitudinal y-axis and extending between a first cutting edge and a second cutting edge, and wherein the x-dimension "x₁" is defined as being offset 90° from the z-dimension "z₁" and extending between a third cutting edge and a surface portion between the first cutting edge and the second cutting edge;

the needle point being displaced a predetermined distance with respect to the longitudinal axis and wherein the predetermined distance is less than $\frac{1}{2}$ the x-dimension " x_t " of the enlarged transition portion; and

Reply to Office Action mailed on March 15, 2010

at least one side of the needled end portion being displaced in the x-dimension

" x_t " by an angle α from a plane parallel to the longitudinal axis, the angle α being between

about 2° and 10°, wherein the side of the needled end portion displaced by angle α from the

plane parallel to the longitudinal axis has a substantially continuous slope between the

enlarged transition portion and the needle point.

2. (Previously presented) The surgical needle according to claim 1 wherein the

planar surface portions of each side are arranged to intersect along a median plane bisecting a

respective side to define a substantially symmetrical concave appearance to the respective

side.

3. (Previously presented) The surgical needle according to claim 1 wherein the

enlarged transition portion defines a z-dimension "z_t" greater than a corresponding z-

dimension "z₁" of the central shaft portion.

4. (Previously presented) The surgical needle according to claim 3 wherein the x-

dimension "x_t" and the z-dimension "z_t" correspond to the height and width respectively of

the transition portion of the needled end portion.

5. (Previously presented) The surgical needle according to claim 1 wherein the

planar surface portions of each side intersect to define an included angle ranging from about

160° to about 175°.

3

6. (Previously presented) The surgical needle according to claim 5 wherein the included angle is about 170°.

7. (Previously presented) The surgical needle according to claim 1 wherein two of the cutting edges intersect at the needle point and define an angle of about 22° to about 25°.

8. (Previously presented) The surgical needle according to claim 1 wherein the central shaft portion defines a distal shaft transition portion adjacent the needled end portion, the distal shaft portion defining a cross-section of general triangular character.

9. (Previously presented) The surgical needle according to claim 8 wherein the distal shaft portion includes three planar surfaces interconnected by rounded surfaces.

10-11. (Canceled)

12. (Previously Presented) A surgical needle, which comprises:

an elongated needle body defining a central longitudinal y-axis along which the needle body extends and transverse x and z-axes, the needle body including a central shaft portion, a first suture end portion for attachment to a suture and a second needled end portion for penetrating tissue, the needled end portion having three sides which intersect to define three cutting edges and terminating at a needle point, each side including a pair of planar surface portions arranged in oblique relation and intersecting along a median plane bisecting a respective side to define a general concave appearance to the respective side, the needled end portion further defining an enlarged transition portion adjacent the central shaft

section;

wherein the enlarged transition portion defines a z-dimension "z_t" and an x-

dimension "x₁", "x_t" being greater than a corresponding x-dimension "x₁" of the central shaft,

wherein the z-dimension "z_t" is defined as being transversely perpendicular to the central

longitudinal y-axis and extending between a first cutting edge and a second cutting edge, and

wherein the x-dimension "x_t" is defined as being offset 90° from the z-dimension "z_t" and

extending between a third cutting edge and a surface portion between the first cutting edge

and the second cutting edge;

the needle point being displaced a predetermined distance with respect to the

longitudinal axis and wherein the predetermined distance is less than ½ the x-dimension "x_t"

of the enlarged transition portion; and

at least one side of the needled end portion being displaced in the x-dimension

" x_i " by an angle α from a plane parallel to the longitudinal axis, the angle α being between

about 2° and 10°, wherein the side of the needled end portion displaced by angle α from the

plane parallel to the longitudinal axis has a substantially continuous slope between the

enlarged transition portion and the needle point.

13. (Canceled)

14. (Previously Presented) The surgical needle according to claim 12 wherein the enlarged transition portion " z_t " at least substantially equal to a corresponding z-dimension " z_1 " of the central shaft.

15. (Previously presented) The surgical needle according to claim 14 wherein the enlarged transition portion " z_l " is greater than the corresponding z-dimension " z_l " of the central shaft portion.

16-19. (Canceled)

- 20. (Previously presented) The surgical needle according to claim 15 wherein each side of the needled end portion includes a single pair of first and second planar surface portions arranged in oblique relation, the first and second planar portions being the pair of planar portions.
- 21. (Previously presented) The surgical needle according to claim 12 wherein each side of the needled end portion includes a single pair of first and second planar surface portions arranged in oblique relation, the first and second planar portions being the pair of planar portions.
- 22. (Previously presented) The surgical needle according to claim 1 wherein each cutting edge is substantially linear.

23. (Canceled)

24. (Previously presented) The surgical needle according to claim 1 wherein the needle body is adapted to assume a curved configuration.

25. (Previously presented) The surgical needle according to claim 12 wherein each cutting edge is substantially linear.

26. (Canceled)
